

NetworkPossum Project Roadmap

Overview

NetworkPossum is an educational network sniffing project designed to teach ethical hacking and network traffic analysis. The project is divided into six main phases, each building upon the previous.

Phases

Phase 0 → Setup - Folder structure creation - GitHub connection - Install dependencies: Python, Scapy, Npcap, matplotlib, Plotly

Phase 1 → Packet Capture - Capture packets using Scapy - Save packet info to logs - Filter basic protocols (TCP, UDP, ICMP)

Phase 2 → Traffic Analysis - Analyze packets: source/destination IP, length, protocol - Identify suspicious patterns - Summarize traffic statistics

Phase 3 → Credential Exposure Demo (SAFE) - Simulate sending sensitive info in plaintext - Demonstrate educational capture of credentials - Strictly for learning/demo purposes only

Phase 4 → Logging & Visualization - Log captured data in structured format - Generate charts and tables from logs - Use matplotlib/Plotly for visualizations

Phase 5 → Documentation & Proof - Record methodology, findings, screenshots - Prepare final report/PDF with diagrams - Ensure reproducibility and clarity

Visual Roadmap Diagram

```
[Phase 0: Setup] ---> [Phase 1: Packet Capture] ---> [Phase 2: Traffic Analysis]
      |               |               |
      v               v               v
[Phase 3: Credential Demo] ---> [Phase 4: Logging & Visualization] ---> [Phase
5: Documentation & Proof]
```

This roadmap provides a clear, step-by-step guide to completing the NetworkPossum project in a structured, educational, and ethical manner.
